reticulum.

Preticulum.

DOMAIN: AC 1 and AC 2 (clusters of ac sorting information. AC 1 directs TGN with the TGN sorting protein PACS-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     FUNCTION: Likely to represent a widespread endoprotease activity within the constitutive and regulated secretory pathway. Capable of cleavage at the RX(K/R)R consensus motif. May be responsible for the maturation of gastrointestinal peptides. May be involved in the cellular proliferation of adrenal cortex via the activation of growth factors.

CATALYTIC ACTIVITY: Release of mature proteins from their proproteins by cleavage of Arg-Xaa-Yaa-Arg-|-Zaa bonds, where Xaa can be any amino acid and Yaa is Arg or Lys.

SUBCELLULAR LOCATION: PC5A is secreted through the regulated secretory pathway. PC5B is a type I membrane protein localized to a paranuclear post-Golgi network compartment in communication with
                                                                                                          isoform B occur at bearing DOMAIN: The propeptide domain assisting the folding of the 7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Event=Alternative splicing; Named isoforms=2; Comment=Additional isoforms seem to exist; Name=PCSB; Synonyms=Long;

Irisula Sprcificity: Highly expressed in spleen, thymus, small intestine and peripheral blood leukocytes. Expressed in resting B-cells and activated T-cells, but not in resting T-cells.

IDISASE: Defects in TNFRSF13B are a cause of common variable immunodeficiency (CVID) [MIM:240500]. CVID is characterized by a defictiency in all immunoglobulin (Ig) isotypes. Individuals with CVID suffer from recurrent sinopulmonary and gastrointestinal infections and have an increased incidence of autoimmune disorders and of lymphoid and nonlymphoid malignancies. There is evidence for a global isotype switching defect in some individuals with CVID. But CVID is a complex and heterogeneous disease in which defects in B-cell survival, number of circulating CD27+ memory B cells (including IgM+CD27+ B cells), B-cell activation after antigen receptor cross-linking, T-cell signaling and cytokine expression have been observed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Hymowitz S.G., Patel D.R., Wallweber H.J., Runyo Shriver S.K., Gordon N.C., Pan B., Skelton N.J., Starovasnik M.A., Structures of APRIL-receptor complexes: like BC a single cysteine-rich domain for high affinity

Mediates calcineurin-dependent activation of NF-AT, as well as activation of NF-AT, as well as activation of NF-kappa-B and AP-1. Involved in the stimulation of B- and T-cell function and the regulation of humoral immunity. SUBUNIT: Binds TRAF2, TRAF5 and TRAF6. Binds the NH2-terminal domain of CAMLG with its C-terminus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   protein.

In vitro studies have suggested that some individuals with IGAD have impaired isotype class switching to IgA and others may have a post-switch defect. IGAD and CVID have been known to coexist in families. Some individuals initially present with IGADI and then develop CVID. These observations suggest that some cases of IGAD and CVID may have a common
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SIMILARITY: Contains 2 TNFR-Cys repeats.
